

Brainstorming & Idea Prioritization

CrediShield AI — Credit Card Approval Prediction System

1. Project Theme

Financial Technology (FinTech) — Automating credit card approval decisions using Machine Learning to reduce manual workload, eliminate human bias, and improve risk assessment accuracy.

2. Ideas Brainstormed

#	Idea	Domain	Feasibility	Impact	Priority
1	Credit Card Approval Prediction using ML	FinTech	High	High	★ Selected
2	Loan Default Risk Predictor	Banking	High	High	Backup
3	Customer Churn Prediction for Banks	CRM	Medium	Medium	Deferred
4	Fraud Detection in Transactions	Cybersecurity	Low (needs real-time)	High	Deferred
5	Personal Finance Budget Advisor	FinTech	Medium	Low	Rejected

3. Idea Selection Criteria (Scoring Matrix)

Criteria	Weight	Credit Card Approval Score
Real-world applicability	25%	9/10
Data availability (public datasets)	20%	10/10 (Kaggle datasets available)
Technical complexity (ML + Web)	20%	8/10
Learning value (end-to-end pipeline)	20%	9/10
Deployability	15%	8/10
Weighted Total	100%	8.85/10

4. Why This Idea Was Prioritized

- **Open Dataset:** Two complementary datasets (`application_record.csv` — 438,510 applicant records and `credit_record.csv` — 1,048,575 payment records) are freely available on Kaggle.
- **Industry Relevance:** Banks and NBFCs process millions of credit applications annually. Manual review is slow, expensive, and inconsistent.
- **Full Stack Scope:** Covers the complete ML lifecycle — data cleaning, feature engineering, model training, evaluation, serialization, REST API, frontend dashboard, and cloud deployment.
- **Class Imbalance Challenge:** The dataset has >98% approval cases vs <2% rejection cases, providing a real-world challenge in handling imbalanced classification — a critical ML concept.
- **Deployment Ready:** The solution is lightweight enough to deploy on free-tier cloud platforms (Render.com), making it accessible for demonstrations.

5. Idea Prioritization Summary

Priority Ranking:

Rank	Idea	Score	Decision
1st	Credit Card Approval Prediction	8.85/10	☒ SELECTED
2nd	Loan Default Risk Predictor	7.90/10	Backup option
3rd	Customer Churn Prediction	6.50/10	Deferred
4th	Fraud Detection	5.80/10	Deferred (needs streaming)
5th	Budget Advisor	4.20/10	Rejected (low impact)

6. Final Selected Idea

Build an end-to-end Credit Card Approval Prediction System that ingests applicant demographic and financial data, trains multiple ML classifiers, selects the best-performing model, and serves predictions through a modern glassmorphism web dashboard with PDF report generation and interactive analytics.

Key Value Propositions:

1. **Automation:** Replaces 7–14 day manual review with sub-second ML predictions.
2. **Consistency:** Same model applied to every application — no human bias.
3. **Transparency:** Confidence scores and risk levels provide explainability.
4. **Audit Trail:** PDF reports and prediction history for compliance records.
5. **Cost Efficiency:** Deployed free on Render; no infrastructure costs.
